the permutation of basic atoms nitrogen hydrogen oxygen carbon and phosphorus into the biomolecules dna and rna subsequently evolved in cells and brains defining the origin of life and intelligence remains unexplained equally the origin of the genetic information and the intertwined nature of hardware and software involved in the evolution of bio molecules and the

cells are shrouded in mystery this treatise aims at exploring individual and swarm behaviour patterns which potentially hint at as yet unknown biological principles it reviews theories of evolution with perspectives from the earth sciences commencing with the earliest observed records of life this is followed by reviews and discussion of the building blocks of life marine and terrestrial communities the arthropods birds and finally humans it is suggested that further to the mutation natural selection processes established by darwin and wallace an understanding of the evolution of intelligence remains little understood a directionality of evolutionary trajectories is evident not least the purposeful thinking process of humans as well as animals it is not clear how directional intelligence manifested for example by the collective intelligence of arthropod colonies has evolved from mutation natural selection processes potential clues for the understanding of life and evolution are provided by aristotle s dictum of the whole being greater than the sum of the parts niels bohr s principle of quantum complementarity and george ellis theory of top down causality inherent in the question of the origin of life is an anthropocentric bias related to the self referential anthropic principle and theological paradigms of man s supposed dominion over all other species the anthropic principle however should be capable of being circumvented using the scientific falsification method assuming universal verified constants of physics the phenomenon of the human mastery of fire and the splitting of the atom leading to the seventh major mass extinction of species remains incomprehensible

evolution is the single unifying principle of biology and core to everything in the life sciences more than a century of work by scientists from across the biological spectrum has produced a detailed history of life across the phyla and explained the mechanisms by which new species form this textbook covers both this history and the mechanisms of speciation it also aims to provide students with the background needed to read the research literature on evolution students will therefore learn about cladistics molecular phylogenies the molecular genetical basis of evolutionary change including the important role of protein networks symbionts and holobionts together with the core principles of developmental biology the book also includes introductory appendices that provide background knowledge on for example the diversity of life today fossils the geology of earth and the history of evolutionary thought key features summarizes the origins of life and the evolution of the eukaryotic cell and of urbilateria the last common ancestor of invertebrates and vertebrates reviews the history of life across the phyla based on the fossil record and computational phylogenetics explains evo devo and the generation of anatomical novelties illustrates the roles of small populations genetic drift mutation and selection in speciation documents human evolution using the fossil record and evidence of dispersal across the world leading to the emergence of modern humans

traditional doctrines of economic policy have largely failed to address the fact that human economies are evolving complex adaptive systems rather than equilibrating mechanisms this volume represents a step towards a more evolutionary approach to economic policy

plant evolutionary ecology is a rapidly growing discipline which emphasizes that populations adapt and evolve not in isolation but in relation to other species and abiotic environmental features such as climate although it departs from traditional evolutionary and ecological fields of study the field is connected to branches of ecology genetics botany conservation and to a number of other fields of applied science primarily through shared concepts

and techniques however most books regarding evolutionary ecology focus on animals creating a substantial need for scholarly literature with an emphasis on plants approaches to plant evolutionary ecology is the first book to specifically explore the evolutionary characteristics of plants filling the aforementioned gap in the literature on evolutionary ecology renowned plant ecologist gregory p cheplick summarizes and synthesizes much of the primary literature regarding evolutionary ecology providing a historical context for the study of plant populations from an evolutionary perspective the book also provides summaries of both traditional common gardens reciprocal transplants and modern molecular genetic approaches used to address questions about plant adaptation to a diverse group of abiotic and biotic factors cheplick provides a rigorously written introduction to the rapidly growing field of plant evolutionary ecology that will appeal to undergraduate and graduate students with an interest in ecology and evolution as well as educators who are teaching courses on related topics

why understanding evolution the most reviled branch of science can help us all from fighting pandemics to undoing racism evolutionary science has long been regarded as conservative a tool for enforcing regressive ideas particularly about race and gender but in a voice in the wilderness evolutionary biologist joseph l graves jr once styled as the black darwin argues that his field is essential to social justice he shows for example why biological races do not exist he dismantles recent work in human biodiversity seeking genes to explain the achievements of different ethnic groups he decimates homophobia sexism and classism as well as a pioneering black biologist a leftist and a christian graves uses his personal story his journey from a child of jim crow to a major researcher and leader of his peers to rewrite his field a voice in the wilderness is a powerful work of scientific anti racism and a moving account of a trailblazing life

winner of the ecpa book of the year award for bible reference works many prominent christians insist that the church must yield to contemporary evolutionary theory and therefore modify traditional biblical ideas about the creation of life they argue that god used albeit in an undetectable way evolutionary mechanisms to produce all forms of life featuring two dozen highly credentialed scientists philosophers and theologians from europe and north america this volume contests this proposal documenting evidential logical and theological problems with theistic evolution making it the most comprehensive critique of theistic evolution yet produced explains why theistic evolution is not congruent with a biblical worldview features nineteen essays written by well known experts in their fields designed to be used as a textbook for courses on religion and evolution accessible for those without expertise in the subject
